

Project management system

See how Catchr can be used as a platform for managing projects, track progress on activities and how to use Catchr data to automatically generate business reports saving hours of manual work.

Elk Creek

Catchr

A better way to run your business

Centralising information

Valuable information is gathered and displayed neatly at finger tips of the users. From here the user can see pictures, open activities and follow the status progress of the project.

Catchr has build in colour labelling system to help the users distinguish between the wind turbines.

Chat with everybody

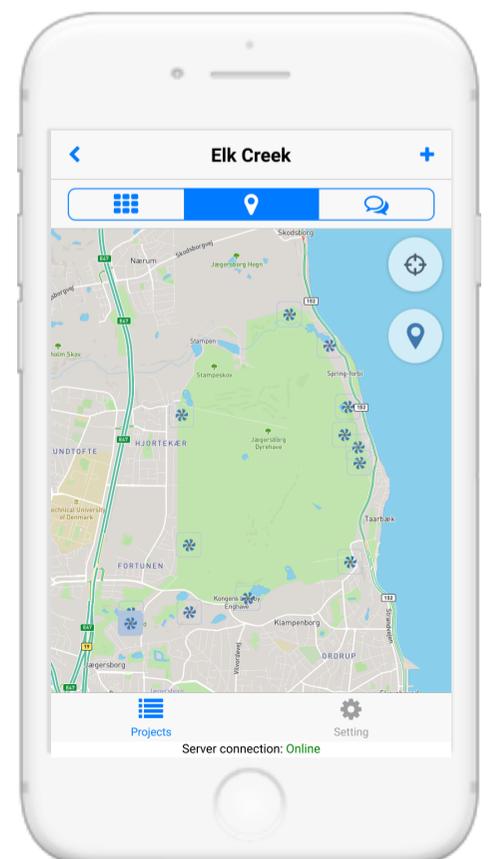

Chat is widely used all over the world because it is fast and easy to use - and it brings people together. This is also why we have build in a great function in Catchr to support great team communication.

In the chat users can report on essential findings, take photos of work completed or simply write enthusiastic messages to keep up the team spirit.

Geolocation at its best

To know where you are going you need to know where you are. On the Elk Creek project wind turbines are placed in their actual physical position making them super easy to find and navigate between.

Since Catchr can be shared with everybody you can share geolocation with customers and suppliers making it extremely easy for everybody to find.

Optimising overall project performance

Using Catchr in this case has increased project execution performance by making information available in the right place at the right time. On project like this time is money and when you dealing with heavy machinery time is a lot of money.

There is a huge difference between an old fashioned reporting approach where users are forced to open their laptop, wait for it to start up, find the right application and fill in a lot of information as posed to simply take out your phone push the button and done!

Catchr data is making its way to the back office where office staff use it for reporting back to management, updating project schedules and send invoices.

Report Automation

Catchr has a secret weapon. It comes with a fully feature API back end - separate from the mobile application. Using the API all the data being collected with Catchr is available through web services.

On the Elk Creek project we have build an automatic Non Conformity Report that is automatically generated with the push of a button.

The automated approach saves many hour - even days of frustrating cut/paste nitty gritty back office work with details. With Catchr it's simply aim shoot and print.

Non Conformity Report
